One of the primary advantages of using RIA for tumor marker analysis is its exceptional sensitivity. RIA can detect tumor markers in extremely low concentrations. Each tumor marker has its own specificity and sensitivity, making it suitable for particular cancer types or stages. By utilizing a panel of tumor markers, clinicians can obtain a comprehensive profile of the patient's disease status

IVD kits in animal research

Most of our in vitro diagnostic tests are designed for use with human samples, but some analytes are not species-specific. Analytes such as steroid hormones (cortisol, progesterone, testosterone), and thyroid hormones (T3, T4, FT3, FT4) are identical across many animal species and can be measured successfully using our immunoassay kits intended for human samples.

Izotop in vitro diagnostic RIA kits have been successfully used by many investigators worldwide as a valuable support to animal science research.
